

Welcome to Tom OS

everything you get — the neon punk edition

A lightweight, Ubuntu-based live operating system with a neon-punk soul — built for Tom. Runs from any USB stick (or Ventoy drive) on x86-64 PCs.

01 · A modern foundation

Ubuntu 26.04 LTS core — the resolute release — a huge software catalogue and full Ubuntu repository access.

Linux kernel 7.2.6 — the newest mainline-stable kernel with ready-built Ubuntu packages, with matching headers for building drivers or modules.

Firmware to date — Ubuntu's full firmware stack plus the upstream linux-firmware 20261019 drop — newest Wi-Fi, GPU and Bluetooth blobs included.

Live and installable — boots straight from USB with zero install, or installs to disk in a few clicks.

02 · The desktop

TDM login screen — the TomOS Display Manager — a neon, Tom OS-branded graphical login with your logo, a “Welcome to Tom OS” greeting, user and session pickers, Caps Lock warning and Suspend / Restart / Shut down buttons.

Hyprland 0.53.3 — a modern, fast, animated Wayland tiling window manager — eye candy without the bloat.

kitty terminal — GPU-accelerated with a custom neon palette, powerline tabs and 10,000 lines of scrollback.

Quickshell neon bar — the default top bar — TOM OS logo chip, pink workspace pill, cyan clock, live volume / CPU / memory, a redesigned neon network badge (Wi-Fi bars, “wired”, “offline”) and a one-click power menu.

Waybar as a backup — prefer the classic bar? SUPER+SHIFT+B swaps between Quickshell and Waybar, and Tom OS remembers your choice.

wofi + mako — an app launcher and pop-up notifications, both themed to match.

hyprlock + hypridle — neon lock screen and idle suspend, so your session stays yours.

03 · The look

Neon punk everywhere — custom TomOS theme for both GTK 3 and GTK 4 apps, dark mode with magenta accents system-wide.

Two 4K wallpapers — the Neon Eclipse design (default) and a synthwave city with your logo. Quickshell draws the wallpaper so it works on any GPU, even in VMs — put a different picture path in ~/.config/tomos/wallpaper to change it.

Your branding — the TOM OS logo on the TDM login screen, the top bar, the terminal, wallpapers, app launcher and installer.

JetBrains Mono Nerd Font — crisp terminal typography with icons and glyphs built in.

welcome to TOM OS — every new kitty window opens with fastfetch, a “welcome to TOM OS” line and a quick shortcuts tip.

04 · The apps

WordCraft 0.11.0 — an open-source, Word-style editor that handles .docx, Markdown and PDF — SUPER+W.

Zoiper 5 free — a full SIP softphone for calls and VoIP accounts — SUPER+Z.

Files, web, text — Nautilus file manager, GNOME Web browser and GNOME Text Editor, all GTK-themed.

Sound done right — PipeWire audio with a PulseAudio compatibility layer and pavucontrol mixing.

fastfetch — runs automatically in kitty with a neon ring-T Tom OS logo, showing your kernel, login manager, bar, CPU, GPU, memory and display.

05 · Live USB superpowers

Calamares installer — a friendly graphical installer — launch “Install Tom OS” from the app launcher (SUPER+D). It writes to the disk you choose, so double-check your target.

Persistence — add a persistence partition to your USB stick and your files and settings survive reboots.

Ventoy friendly — a standard hybrid ISO built for Ventoy, Rufus, dd or Etcher — BIOS and UEFI (Secure Boot off).

Nothing to risk — the live session runs from the USB stick — nothing is written to your disk unless you launch the installer.

06 · First five minutes

1 — boot the USB — the TDM login screen says “Welcome to Tom OS”. Sign in as tom / live.

2 — press SUPER+ENTER for a terminal, SUPER+D to launch apps.

3 — connect to Wi-Fi by clicking the neon network badge in the top bar.

4 — like it? Run “Install Tom OS” and make it permanent.

5 — keep the Keyboard Shortcuts card nearby — every keybind is on it.

The real Tom OS desktop: Quickshell neon bar on top, kitty with fastfetch below.

Tom OS 26.10 · neon punk edition — built with live-build, Hyprland, and a lot of magenta.
